Abstract

This article describes the use and implementation of L^AT_EX-package **struktex.sty** for structured box charts (Nassi-Shneiderman diagrams).

2 Preface

`StrukTeX` has a long history. In development several different programs for version management were used—rcs, subversion and currently git—, all of which offer different possibilities to define version numbers. To correlate these different version numbers correctly in time, the following schema will be used: Version numbers of the form “v- $\langle d \rangle.\langle d \rangle[\langle a \rangle]$ ” with $\langle d \rangle$ as a decimal digit and $\langle a \rangle$ as a character, say v-4.1a denote the first development line (rcs). The following version numbers have the form “v $\langle n \rangle\langle n \rangle\langle n \rangle$ ” with $\langle n \rangle$ as a decimal number, e.g. v122 (subversion). The current development is under git and uses version numbers of the form $\langle d \rangle.\langle d \rangle[\langle a \rangle][\langle d \rangle]-g\langle x \rangle$, for example, v2.1-13-gd28a927; $\langle x \rangle$ stands for a hexadecimal number. In general, the age and therefore the sequence of the versions is

$$v-\langle d \rangle.\langle d \rangle[\langle a \rangle] < v\langle n \rangle\langle n \rangle\langle n \rangle < v\langle d \rangle.\langle d \rangle[\langle a \rangle][-\langle d \rangle]-g\langle x \rangle$$

It is possible to draw structured box charts by this package of macros which is described herewith. Through this article the package will be always called `StrukTeX`. It can generate the most important elements of a structured box chart like processing blocks, loops, mapping conventions for alternatives etc.¹

Since version v-4.1a the mathematical symbols are loaded by `AMS-Tex`. They extend the mathematical character set and make other representations of symbols sets (like \mathbb{N} , \mathbb{Z} and \mathbb{R} for the natural, the integer and the real numbers) possible. Especially the symbol for the empty set (\emptyset) has a more outstanding representation than the standard symbol (“‘ \varnothing ’”). Therefore it is the better representation in structured box charts.

Furthermore the idea to set names of variables in *italics* without generating the partly unpleasant distances is taken over from `oz.sty`.

The development of this macro package is still not finished. It was planned to draw the structured box charts by using the macros of `emlinest2.sty` for eliminating the constraints given by L^AT_EX. – There are only predefined gradients. – This is done for the `\ifthenelse` in the versions v-4.1a and v-4.1b and for `\switch` in the version v-4.2a, but not for the systems, which do not support the corresponding `\special{...}`-commands. Nevertheless it can be attained by using the corresponding macros of `curves.sty`. Since version v-8.0a the package `pict2e` is supported. This package eliminates the above mentioned constraints by using the common drivers, so it is recommended to use the respective (see below) option permanently.

¹ Those who don't like to code the diagrams by hand, can use for example the program Strukturizer (<http://strukturizer.fisch.lu/>). By using this program one can draw the diagrams by mouse and export the result into a L^AT_EX-file.

Just so it is planned to extend structured box charts by comments as they are used in the book of Futschek ([Fut89]). This is also implemented in version v-8.0a.

Further plans for future are:

1. An \otherwise-branch at \switch (done in version v-4.2a).
2. The reimplementation of the `declaration`-environment through the `list`-environment by [GMS94, Abs. 3.3.4] (done in version v-4.5a).
3. The adaption to L^AT_EX 2 _{ε} in the sense of packages (done in version v-4.0a).
4. The improvement of documentation in order to make parts of the algorithm more understandable.
5. The independence of `struktex.sty` of other `.sty`-files like e.g. `JHfMakro.sty` (done in version v-4.5a).
6. The complete implementation of the macros `\pVar`, `\pKey`, `\pFonts`, `\pTrue`, `\pFalse` and `\pBoolValue` (done before version v-7.0).
7. The complete internalization of commands, which only make sense in the environment `struktogramm`. Internalization means, that these commands are only defined in this environment. This is for compatibility of this package with other packages, e.g. with `ifthenelse.sty`. The internalization has been started in version v-4.4a.
8. The independence of the documentation of other `.sty`-files like `JHfMakro.sty` (done in version v-5.0).
9. an alternative representation of declarations as proposed by Rico Bolz
10. Reintroduction of the make-targets `dist-src` `dist-tar` and `dist-zip`.

The current state of the implementation is noted at suitable points.

3 Hints for maintenance and installation as well as driver file creating of this documentation

The package `struktex.sty` is belonging to consists of altogether two files:

LIESMICH,
README,
`struktex.ins`,
`struktex.dtx`,
`struktex.de.pdf` und
`struktex.en.pdf`.

In order to generate on the one hand the documentation and on the other hand the `.sty`-file one has to proceed as follows:

First the file `struktex.ins` will be formatted e.g. with

```
tex struktex.ins
```

. This formatting run generates eleven further files. These are first of all the three .sty-files `struktex.sty`, `struktxf.sty` and `struktxp.sty`, that are used for `struktex.sty`. Furthermore these are the two files `struktex_test_0.nss` and `struktdoc.sty`, which are used for the generation of the hereby presented documentation. Then there are three test files `struktex_test_i.nss`, $i = 1(2)3$ as well as the files `struktex.makemake` and `struktex.mk` (see section 8).

The common procedure to produce the documentation is²

```
pdflatex struktex.dtx
pdflatex struktex.dtx
makeindex -s gind.ist struktex.idx
pdflatex struktex.dtx
```

The result of this formatting run is the documentation in form of a .pdf-file, that can be manipulated the normal way. Further informations about the work with the integrated documentation one can find in [Mit01] and [MDB01].

To finish the installation, the file `struktex.sty` should be moved to a directory, where TeX can find it, in a TDS conforming installation this is `.../tex/latex/struktex/` typical, analogously the documentation has to be moved to `.../doc/latex/struktex/`. If the installation process is done automatically (see section 8), the target directories follow that rule.

If one wants to carry out changes, the values of `\fileversion`, `\filedate` and `\docdate` should be also changed if needed. Furthermore one should take care that the audit report will be carried on by items in the form of

```
\changes{\langle version \rangle}{\langle date \rangle}{\langle comment \rangle}
```

The version number of the particular change is given by `\langle version \rangle`. The date is given by `\langle date \rangle` and has the form `yy/mm/dd`. `\langle comment \rangle` describes the particular change. It need not contain more than 64 characters. Therefore commands should'nt begin with “\” (backslash), but with the ““” (accent).

The following commands make up the driver of the documentation lieing before.

```
1 (*driver)
2 % select the formatting language:
3 \expandafter\ifx\csname primarylanguage\endcsname\relax%
4 \def\primarylanguage{ngerman}%
5 \def\secondarylanguage{english}%
6 \else%
7 \def\secondarylanguage{ngerman}%
8 \fi
9
10 \documentclass[a4paper, \secondarylanguage,      % select the language
11           \primarylanguage]{ltxdoc}
12
13 \PassOptionsToPackage{obeyspaces}{url} % must be done before any package is
14           % loaded
15
16 \usepackage{babel}                   % for switching the documentation language
17 \usepackage{struktdoc}               % the style-file for formatting this
18           % documentation
19
```

²Generating the documentation is much easier with the `make` utility, see section 8.

```

20 \usepackage[pict2e, % <----- to produce finer results
21                                         % visible under xdvi, alternatives are
22                                         % curves or emlines2 (visible only under
23                                         % ghostscript), leave out if not
24                                         % available
25     verification,
26     outer, % <----- to set the position of the \ifthenelse
27                                         % flags to the outer edges

58 \end{document}
59 
```

4 The User interface

The struktex.sty will be included in a L^AT_EX-document like every other .sty-file by *package*:

```
\usepackage[<i>(options)</i>]{struktex}
```

The following options are available:

1. `english`, `ngerman` oder `german`:

This option defines the language of defined values as `\sTrue`, default: `english`.

2. **emlinies**, **curves**, or **pict2e**:

If you set one of these options, any ascent can be drawn in the structured box chart. You should use **emlinies**, if you are working with the emTEX-package for DOS or OS/2 by E. Mattes, else you should use **pict2e**; **curves** is included just for compatibility. In all cases the required packages (**emlinie2.sty**, **curves.sty**, or **pict2e** resp.) will be loaded automatically; the default value is **pict2e**.

3. **verification**:

Only if this option is set, the command **\assert** is available.

4. **nofiller**:

Setting this option prohibits setting of \emptyset in alternatives.

5. **draft**, **final**:

These options serve as usual to differentiate between the draft and the final version of a structured box chart (see **\sProofOn**). While in the draft mode the user given size of the chart is denoted by the four bullets, the final version leaves out these markers; the default value is **final**.

6. **debug**:

Setting this option produces lines of the form **==> dbg <text>** in the .log-file.

7. **outer**:

Setting this option changes the position of flags in the **ifthenelse**-triangles from the mid to the left and right of the baselines of the triangles.

After loading the **.sty**-file there are different commands and environments, which enable the draw of structured box charts.

\StrukTeX First of all the logo StrukTeX producing command should be mentioned:

\StrukTeX

So in documentations one can refer to the style option given hereby.

4.1 Specific characters and text representation

\nat Since sets of natural, whole, real and complex numbers (\mathbb{N} , \mathbb{Z} , \mathbb{R} and \mathbb{C}) occur often in the Mathematics Mode they can be reached by the macros **\nat**, **\integer**, **\real** and **\complex**. Similarly " \emptyset ", which is generated by **\emptyset**, is the more remarkable symbol for the empty statement than the standard symbol " \varnothing ". Other set symbols like \mathbb{L} (for solution space) have to be generated by **\mathbb{L}**.
\MathItalics One can influence the descriptions of variable names by these macros.
\MathNormal

NewValue = OldValue + Correction

```
\MathNormal
\[[
  NewValue = OldValue + Correction
\]
```

und

```

$$NewValue = OldValue + Correction$$

\MathItalics
\[  

  NewValue = OldValue + Correction  

\]

```

4.2 Macros for representing variables, keywords and other specific details of programming

\pVariable Structured box charts sometimes include code, that has to be programmed directly. For achieving a homogenous appearance the mentioned macros have been defined. They have been collected in a separate package `struktxp.sty` to be able to use them in another context. From version 122 on `struktxp.sty` is based on "url.sty" of Donald Arsenau. This package makes allows to pass verbatim texts as parameters to other macros. If this verbatim stuff contains blank spaces, which should be preserved, the user has to execute the command

```
\PassOptionsToPackage{obeyspaces}{url}
```

before `url.sty` is loaded, that is in most of the cases before the command

```
\usepackage{struktex}
```

Variable names are set by `\pVariable{\langle VariableName \rangle}`. There `\langle VariableName \rangle` is an identifier of a variable, whereby the underline "`_`", the commercial and "`&`" and the hat "`^`" are allowed to be parts of variables:

<code>cANormalVariable</code>	<code>\obeylines</code>
<code>c_a_normal_variable</code>	<code>\pVariable{cANormalVariable}</code>
<code>&iAddressOfAVariable</code>	<code>\pVariable{c_a_normal_variable}</code>
<code>pPointerToAVariable^.sContent</code>	<code>\pVariable{&iAddressOfAVariable}</code>
	<code>\pVariable{pPointerToAVariable^.sContent}</code>

Blanks are considered such, that whole statements can be written. For abbreviation it is allowed to use `\pVar`.

A keyword is set by `\pKeyword{\langle keyword \rangle}` respectively. There `\langle keyword \rangle` is a keyword in a programming language, whereby the underline "`_`" and the hash symbol "`#`" are allowed to be parts of keywords. Therewith the following can be set:

<code>begin</code>	<code>\obeylines</code>
<code>program</code>	<code>\pKeyword{begin}</code>
<code>#include</code>	<code>\renewcommand{\pLanguage}{Pascal}</code>
	<code>\pKeyword{program}</code>
	<code>\renewcommand{\pLanguage}{C}</code>
	<code>\pKeyword{#include}</code>

`\pKeyword` is also allowed to be abbreviated by `\pKey`. With that the source code

```
\renewcommand{\pLanguage}{Pascal}
\pKey{begin} \pExp{iVar := iVar + 1;} \pKey{end}
```

generates the following result as output:

```
begin iVar := iVar + 1; end
```

In a similar way `\pComment` is of representation purposes of comments. The argument is only allowed to consist of characters of the category *letter*. Characters, that start a comment, have to be written. `\pComment` can't be abbreviated. For instance

```
\pExp{a = sqrt(a);} \pComment{// Iteration}
```

results in the line

```
a = sqrt(a); // Iteration
```

`\pTrue` Boolean values play an important role in programming. There are given adequate values by `\pTrue` and `\pFalse`: `true` and `false`.
`\pFalse`
`\pFonts` The macro `\pFonts` is used for the choice of fonts for representation of variables, keywords and comments:
`\pBoolValue`

```
\pFonts{\langle variablefont \rangle}{\langle keywordfont \rangle}{\langle commentfont \rangle}
```

The default values for the certain fonts are

- `\langle variablefont \rangle` as `\small\sffamily`,
- `\langle keywordfont \rangle` as `\small\sffamily\bfseries` and
- `\langle commentfont \rangle` as `\small\sffamily\slshape`.

With that the above line becomes

```
a = sqrt(a); // Iteration
```

Similarly the values of `\pTrue` and `\pFalse` can be redefined by the macro

```
\sBoolValue{\langle Yes-Value \rangle}{\langle No-Value \rangle}
```

So the lines

```
\renewcommand{\pLanguage}{Pascal}
\sBoolValue{\textit{yes}}{\textit{no}}
\pFalse = \pKey{not} \pTrue
```

result in the following:

```
no= not yes
```

`\sVar` The macros `\sVar` and `\sKey` are the same as the macros `pVar` and `pKey`.
`\sKey` Here they are just described for compatibility reasons with former versions of
`\sTrue` `struktex.sty`. The same rule shall apply to the macros `\sTrue` and `\sFalse`.
`\sFalse`

4.3 The Macros for generating structured box charts

`struktogramm` The environment

```
\sProofOn
\sProofOff
\PositionNSS
\begin{struktogramm}(<width>, <height>) [<titel>]
...
\end{struktogramm}
```

generates space for a new box chart. Both the parameters provide the width and the height of the place, which is reserved for the structured box chart. Lengths etc. are described in millimeters. In doing so the actual value of `\unitlength` is unimportant. At the same time the width corresponds with the real width and the real height will be adjusted to the demands. If the given height doesn't match with the real demands, the structured box chart reaches into the surrounding text or there is empty space respectively. There is a switch `\sProofOn`, with which the stated dimensions of the structured box charts is given by four points to make corrections easier. `\sProofOff` similarly switches this help off. The title is for identification of structured box charts, if one wants to refer to this from another part, e.g. from a second box chart.

The structured box chart environment is based on the `picture` environment of L^AT_EX. The unit of length `\unitlength`, which is often used in the `picture` environment, is not used in structured box charts. The unit of length is fixed by 1 mm for technical reasons. Furthermore all of length specifications have to be whole numbers. After drawing a structured box chart by St^Ru_TE_X `\unitlength` is of the same quantity as before. But it is redefined within a structured box chart and need not be changed there.

`\assign` The main element of a structured box chart is a box, in which an operation is described. Such a box will be assigned by `\assign`. The syntax is the following:

```
\assign[<height>]{<content>},
```

where the square brackets name an optional element as usual. The width and the height of the box will be adjusted automatically according to demands. But one can predefined the height of the box by the optional argument.

The *text* is normally set centered in the box. If the text is too long for that, then a (justified) paragraph is set.

Example 1

A simple structured box chart will be generated by the following instructions:

```
\sProofOn
\begin{struktogramm}(70,20)[1.\ trial]
\assign{Root of $\pi$, calculation and output}
\end{struktogramm}
\sProofOff
```

These instructions lead to the following box chart, at which the user has to provide an appropriate positioning like in the basing `\picture` environment. Herewith the positioning is normally done by the quote environment. But one can also center the structured box chart by the center environment. The width of the box chart is given by 70mm, the

height by 12mm. An alternative is given by the `center` environment, that is described on page 21

At the same time the effect of `\sProofOn` and `\sProofOff` is shown, at which the too large size of structured box chart has to be taken notice of.

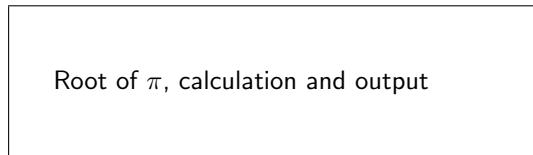

The meaning of the optional argument will be made clear by the following example:

Example 2

The height of the box is given by:

```
\begin{center}
\begin{struktogramm}{70,20}
\assign[20]{Root of $\pi$, calculation and output}
\end{struktogramm}
\end{center}
```

These instructions lead to the following structured box chart. In doing so it is to pay attention on the `struktogramm` environment, which has been centered by the `center` environment, at which the width of the structured box chart is again given by 70mm, but the height by 20mm this time.

declaration

The `declaration` environment is used for the description of variables or interfaces respectively. Its syntax is given by

```
\begin{declaration}[(titel)]
...
\end{declaration}
```

\declarationtitle

The declaration of the title is optional. If the declaration is omitted, the standard title: 'Providing Memory Space' will be generated. If one wants to have another text, it will be provided globally by `\declarationtitle{<title>}`. If one wants to generate a special title for a certain structured box chart, one has to declare it within square brackets.

Within the `declaration` environment the descriptions of the variables can be generated by

```
\description{<variableName>}{<variableDescription>}
```

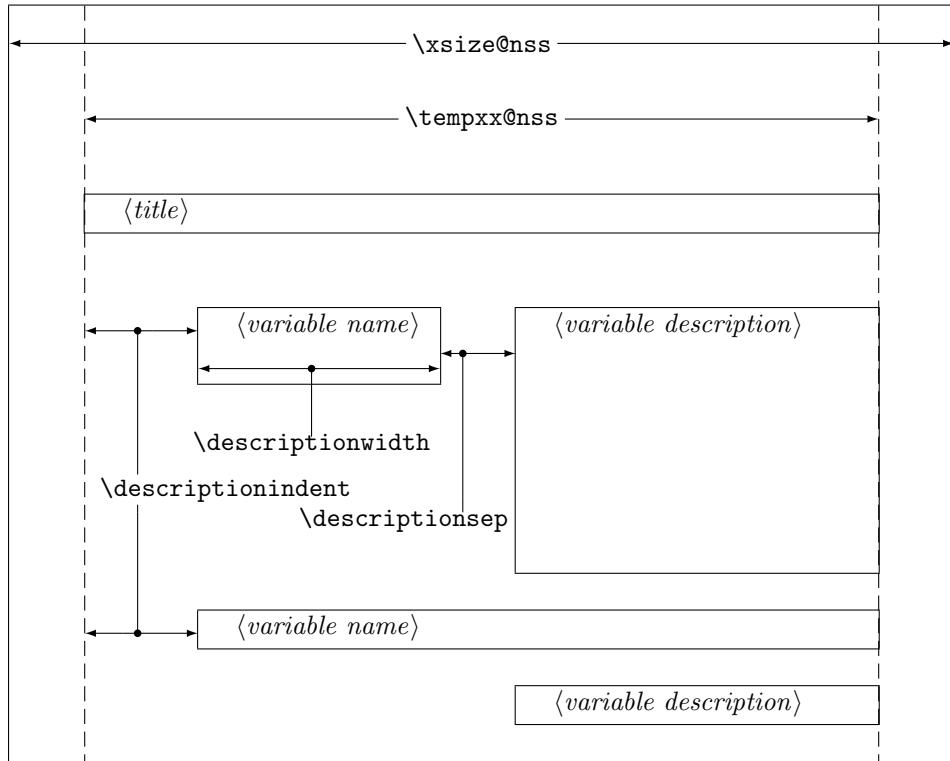

Figure 1: Construction of a Variable Description

In doing so one has to pay attention on the $\langle \text{variableName} \rangle$, that is not allowed to content a right square bracket "]", because this macro has been defined by the `\item` macros. Square brackets have to be entered as `\lbracket` or `\rbracket` respectively.

The shape of a description can be controled by three parameters: `\descriptionindent`, `\descriptionwidth` and `\descriptionsep`. The meaning of the parameters can be taken from 1 (`\xsize@nss` and `\xin@nss` are internal sizes, that are given by `Sty`_{TeX}). The default values are the following:

```
\descriptionindent=1.5em
\descriptionwidth=40pt
\descriptionsep=\tabcolsep
```

The significance of `\descriptionwidth` is, that a variable name, which is shorter than `\descriptionwidth`, gets a description of the same height. Otherwise the description will be commenced in the next line.

Example 3

First there will be described only one variable.

```
\begin{struktogramm}(95,20)
\assign%
{%
\begin{declaration}
```

```

    \description{\pVar{iVar}}{an \pKey{int} variable, which is
                           described here just for presentation of the
                           macro}
    \end{declaration}
}
\end{struktogramm}

```

The corresponding structured box chart is the following, at which one has to pay attention, that there are no titels generated by the empty square brackets.

providing memory space:

iVar {an **int** variable, which is described
here just for presentation of the macro}

Now variables will be specified more precisely:

```

\begin{struktogramm}(95,50)
\assign{%
\begin{declaration}[Parameter:]
\description{\pVar{iPar}}{an \pKey{int} parameter with the
                           meaning described here}
\end{declaration}
\begin{declaration}[local Variables:]
\description{\pVar{iVar}}{an \pKey{int} variable with the meaning
                           described here}
\description{\pVar{dVar}}{a \pKey{double} variable with the
                           meaning described here}
\end{declaration}
}
\end{struktogramm}

```

This results in:

Parameter:

iPar {an **int** parameter with the meaning
described here}

local Variables:

iVar {an **int** variable with the meaning de-
scribed here}

dVar {a **double** variable with the meaning
described here}

Finally the global declaration of a titel:

```

\def\declarationtitle{global variables}
\begin{struktogramm}(95,13)

```

```

\assign{%
\begin{declaration}
\description{\pVar{iVar_g}}{an \pKey{int} variable}
\end{declaration}
}
\end{struktogramm}

```

This results in the following shape:

global variables <i>iVar_g</i> {an int variable}

Here one has to notice the local realisation of the \catcode of the underline, which is necessary, if one wants to place an underline into an argument of macro. Although this local transfer is already realized at \pVar it doesn't suffice with the technique of macro expanding of T_EX.

\sub The mapping conventions for jumps of subprograms and for exits of program
\return look similar and are drawn by the following instructions:

```

\sub[<height>]{<text>}
\return[<height>]{<text>}

```

The parameters mean the same as at \assign. The next example shows how the mapping conventions are drawn.

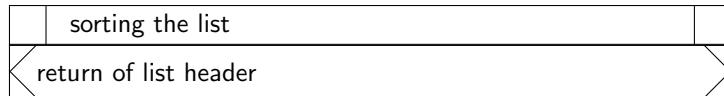

Example 4

```

\begin{struktogramm}(95,20)
\sub{sorting the list}
\return{return of list header}
\end{struktogramm}

```

These instructions lead to the following structured box chart:

\while For representation of loop constructions there are three instructions available:
\whileend \while, \until and \forever. The while loop is a repetition with preceding condition check (loop with a pre test). The until loop checks the condition at the end of the loop (loop with a post test). And the forever loop is a neverending loop, that can be left by \exit.
\forallallinend
\forever
\foreverend

```

\while[<width>]{<text>}{structured subbox chart}
\whileend
\until[<width>]{<text>}{structured subbox chart}
\foreverend

```

```
\untilend
\forever[<width>]<structured subbox chart>\foreverend
\exit[<height>]<text>
```

$\langle width \rangle$ is the width of frame of the mapping convention and $\langle text \rangle$ is the conditioning text, that is written inside this frame. If the width is not given, the thickness of frame depends on the height of text. The text will be written left adjusted inside the frame. If there isn't given any text, there will be a thin frame.

A control structure which nowadays is provided by many programming languages is a loop known as `forall-`, `for ... in-`, or `foreach`-loop. This kind of loop can be seen as tail first loop but some people prefer the form of the endless loop with included text. For this case there is the control structure

```
\forallin[<width>]{<text>}<structured subbox chart>\forallinend
```

Instead of $\langle structured subbox chart \rangle$ there might be written any instructions of `StrukTEX` (except `\openstrukt` and `\closestrukt`), which build up the box chart within the `\while` loop, the `\until` loop or the `\forever` loop.

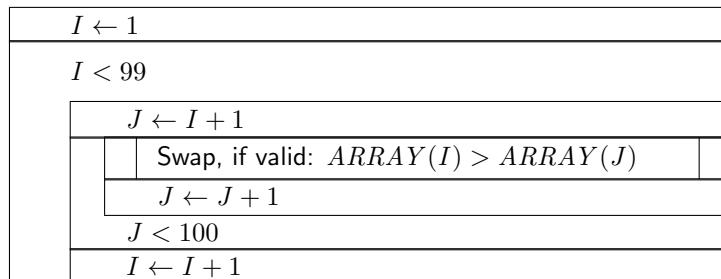

For compatibility with further development of the `struktex.sty` of J. Dietel there are the macros `\dfr` and `\dfrend` with the same meaning as `\forever` and `\foreverend`.

The two following examples show use of `\while` and `\until` macros. `\forever` will be shown later.

Example 5

```
\begin{struktogramm}(95,40)
\assign{\(I \gets 1\)}
\while[8]{\(I < 99\)}
    \assign{\(J \gets I+1\)}
    \until{\(J < 100\)}
        \sub{Swap, if valid: \(( ARRAY(I) > ARRAY(J) \))}
            \assign{\(J \gets J+1\)}
        \untilend
        \assign{\(I \gets I+1\)}
\whileend
\end{struktogramm}
```

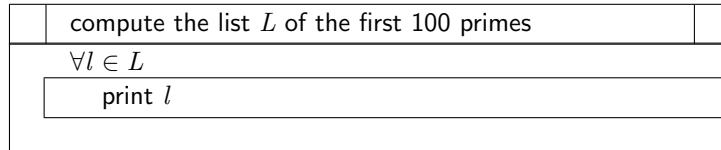

These instructions lead to the following structured box chart:

Example 6

```
\begin{struktogramm}{95, 25}
  \sub{compute the list \L of the first 100 primes}
  \forallin{\forall 1\in L}
    \assign{print \l}
  \forallinend
\end{struktogramm}
```

These instructions lead to the following structured box chart:

The `\exit` instruction only makes sense in connection with simple or multiple branches. Therefore it will be presented after the discussion of branches.

```
\ifthenelse
  \change
  \ifend
```

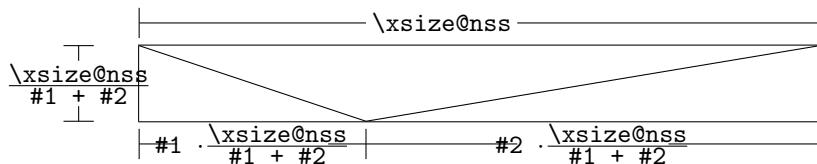

For the representation of alternatives `StrukTeX` provides mapping conventions for an If-Then-Else-block and a Case-construction for multiple alternatives. Since in the traditional `picture` environment of `LATeX` only lines of certain gradients can be drawn, in both cases the user has to specify himself the angle, with which the necessary slanted lines shall be drawn. (Here is a little bit more ‘handy work’ required.)

If however the `curves.sty`, the `emlines2.sty` or the `pict2e.sty` is used, then the representation of lines with any gradient can be drawn.

The If-Then-Else-command looks like:

```
\ifthenelse[<height>]{<left angle>}{<right angle>}
  {<condition>}{<left text>}{<right text>}
  <structured subbox chart>
\change
  <structured subbox chart>
\ifend
```

In the case of omitting the optional argument `<height>` `<left angle>` and `<right angle>` are numbers from 1 to 6. They specify the gradient of both the partitioning lines of the If-Then-Else-block (large number = small gradient). Larger values are put on 6, smaller values on 1. The precise characteristics of the gradients can be taken from the following picture. Thereby `\xsize@nss` is the width of the actual structured subbox chart. If the `<height>` is given, then this value determines the height of the conditioning rectangle instead of the expression $\frac{\xsize@nss}{\#1 + \#2}$.

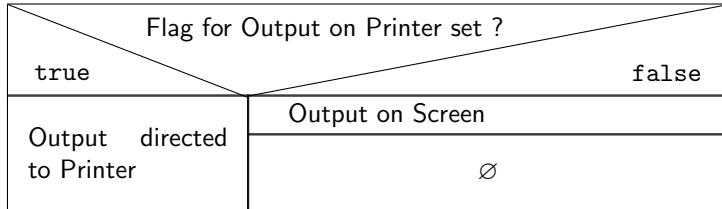

$\langle condition \rangle$ is set in the upper triangle built in the above way. The parameters $\langle left\ text \rangle$ and $\langle right\ text \rangle$ are set in the left or right lower triangle respectively. The conditioning text can be made up in its triangle box. From version v-5.3 on the conditioning text ...³ Both the other texts should be short (e.g. yes/no or true/false), since they can't be made up and otherwise they stand out from their triangle box. For obtaining uniformity here the macros `\pTrue` and `\pFalse` should be used. Behind `\ifthenelse` the instructions for the left "structured subbox chart" are written and behind `\change` the instructions for the right "structured subbox chart" are written. If these two box charts have not the same length, then a box with \emptyset will be completed. The If-Then-Else-element is finished by `\ifend`. In the following there are two examples for application.

Example 7

```
\begin{struktogramm}(95,32)
\ifthenelse[12]{1}{2}
  {Flag for Output on Printer set ?}{\sTrue}{\sFalse}
  \assign[15]{Output directed to Printer}
\change
  \assign{Output on Screen}
\ifend
\end{struktogramm}
```

These instructions lead to the following structured box chart:

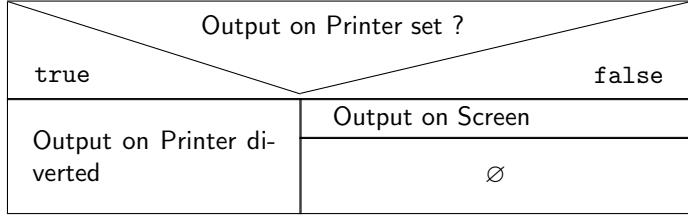

Example 8

```
\begin{struktogramm}(90,30)
\ifthenelse{3}{4}
  {Output on Printer set ?}{\sTrue}{\sFalse}
  \assign[15]{Output on Printer diverted}
\change
  \assign{Output on Screen}
\ifend
\end{struktogramm}
```

These instructions lead to the following structured box chart:

³This extension is due to Daniel Hagedorn, whom I have to thank for his work.

\case
\switch
\caseend

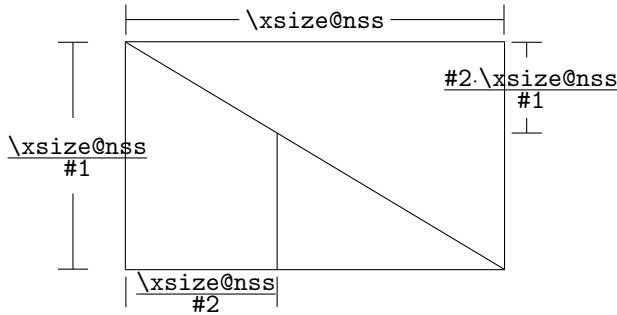

The Case-Construct has the following syntax:

```

\case[<height>]{<angle>}{<number of cases>}{<condition>}{<text of 1. case>}{<structured subbox chart>}
\switch[<position>]{<text of 2. case>}{<structured subbox chart>}
...
\switch[<position>]{<text of n. case>}{<structured subbox chart>}
\caseend

```

If the *<height>* is not given, then the partitioning line of the mapping convention of case gets the gradient given by *<angle>* (those values mentioned at \ifthenelse). The text *<condition>* is set into the upper of the both triangles built by this line. The proportions are sketched below:

The second parameter *<number of cases>* specifies the number of cases, that have to be drawn. All structured subbox charts of the certain cases get the same width. The *<text of 1. case>* has to be given as a parameter of the \case instruction. All other cases are introduced by the \switch instruction. Behind the text the instructions for the proper structured subbox chart of certain case follow. The last case is finished by \caseend. A mapping convention of case with three cases is shown in the following example.

Example 9

```

\begin{struktogramm}{95,30}
\case{4}{3}{Signum(x){-1}}
\assign{$z \gets - \frac{1}{x}}
\switch{0}

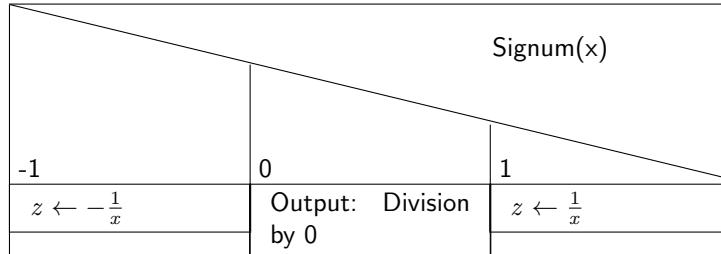

```

```

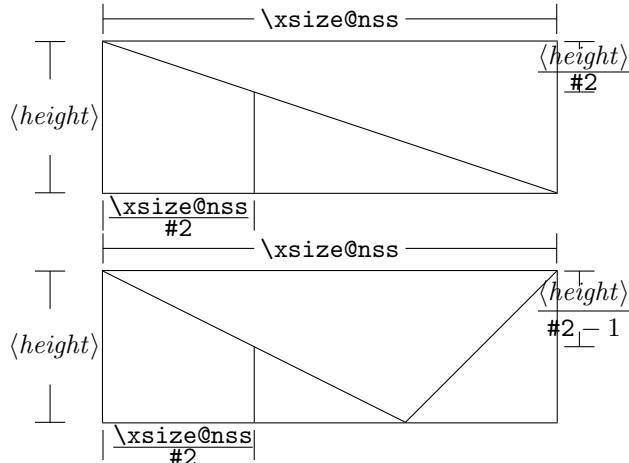

\assign{Output: Division by 0}
\switch{1}
  \assign{$z \gets \frac{1}{x}$}
\caseend
\end{struktogramm}

```

These instructions lead to the following structured box chart:

The optional parameter $[(height)]$ can be used if and only if one of the options “curves”, “emlines2” or “pict2e”, resp. is set; if this is not the case, the structured chart box may be scrambled up. The extension of the `\switch` instruction by $[(height)]$ results in the following shape with a different gradient of a slanted line, which now is fixed by the height given by the optional parameter. If the value of the parameter $\langle angle \rangle$ is even, a straight line is drawn as before. If the value is odd, the last case is drawn as a special case as showed below.

Example 10

```

\begin{struktogramm}(95,30)
\case[10]{4}{3}{Signum(x)}{-1}
  \assign{$z \gets -\frac{1}{x}$}
\switch{0}
  \assign{Output: Division by 0}
\switch{1}
  \assign{$z \gets \frac{1}{x}$}
\caseend

```

```
\end{struktogramm}
```

These instructions lead to the following structured box chart:

Signum(x)		
-1	0	1
$z \leftarrow -\frac{1}{x}$	Output: Division by 0	$z \leftarrow \frac{1}{x}$

But if the first parameter is odd, then a default branch is drawn; the value for the default branch should be set flushed right.

Example 11

```
\begin{struktogramm}(95,30)
  \case[10]{5}{3}{Signum(x)}{-1}
    \assign{$z \gets -\frac{1}{x$}}
  \switch{1}
    \assign{$z \gets \frac{1}{x$}
  \switch{0}
    \assign{Output: Division by 0}
  \caseend
\end{struktogramm}
```

These instructions lead to the following structured box chart:

Signum(x)		
-1	1	0
$z \leftarrow -\frac{1}{x}$	$z \leftarrow \frac{1}{x}$	Output: Division by 0

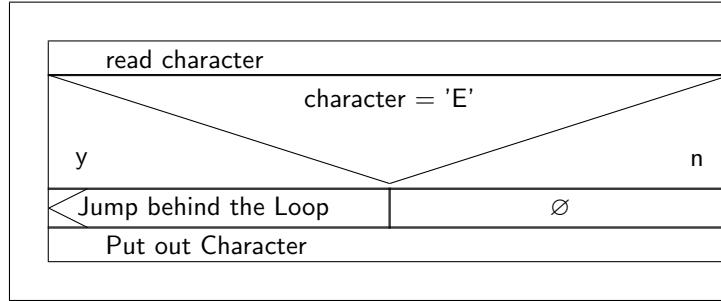

The following example shows, how one can exit a neverending loop by a simple branch. The example is transferable to a multiple branch without much effort.

Example 12

```
\begin{struktogramm}(95,40)
  \forever
    \assign{read character}
    \ifthenelse{3}{3}{character = 'E'}
      {y}{n}
      \exit{Jump behind the Loop}
    \change
    \ifend
    \assign{Put out Character}
  \foreverend
```

```
\end{struktogramm}
```

These instructions lead to the following structured box chart:

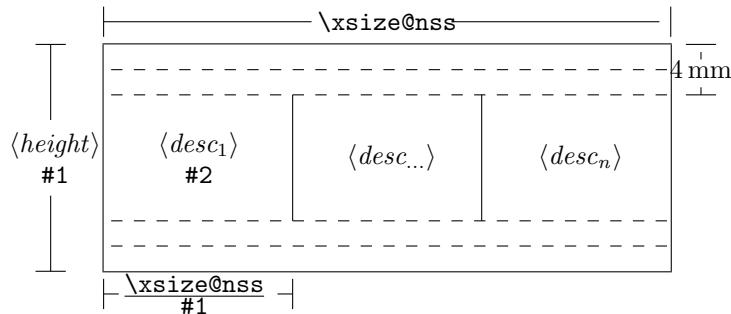

```
\inparallel
  \task
```

```
\inparallelend
```

Nowadays multicore processors or even better massive parallel processors are a common tool for executing programs. To use the features of these processors parallel algorithms should be developed and implemented. The `\inparallel` command enables the representation of parallel processing in a program. The syntax is as follows:

```
\inparallel[(height of 1st task)]{(number of
parallel tasks)}{(description of 1st task)}
\task[(position)]{(description of 2nd task)}
...
\task[(position)]{(description of nth task)}
\inparallelend
```

The layout of the box is as follows (the macro parameters #1 and #2 refer to the parameters of `\inparallel`):

Note: the tasks are not allowed to get divided by `\assign` or so. If one needs some finer description of a task, this should be made outside of the current structured box chart.

Example 13 (Application of `\inparallel`)

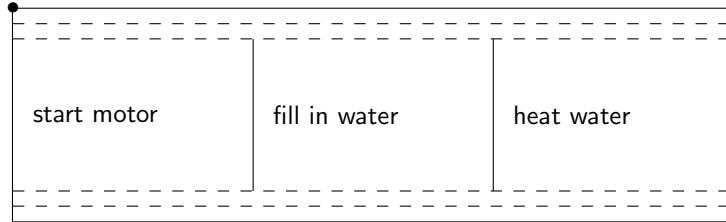

```
\begin{struktogramm}(95,40)
\inparallel[20]{3}{start motor}
```

```

\task{fill in water}
\task{heat water}
\inparallelend
\end{struktogramm}

```

These instructions produce the following structured box chart:

center
If a structured box chart shall be represented centered, then the environment

```

\begin{center}
\begin{struktogramm}
<Struktogramm>
\end{struktogramm}
\end{center}

```

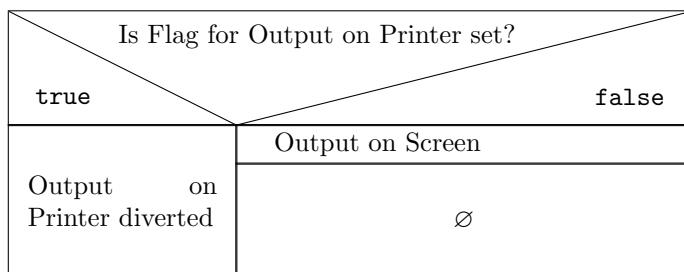

is used:

```

\begin{center}
\begin{struktogramm}{(90,35)}
\ifthenelse{2}{4}{%
{Is Flag for Output on Printer set?}{\sTrue}{\sFalse}%
\assign[20]{Output on Printer diverted}
\change
\assign{Output on Screen}
\ifend
\end{struktogramm}
\end{center}

```

This leads to the following:

\CenterNssFile

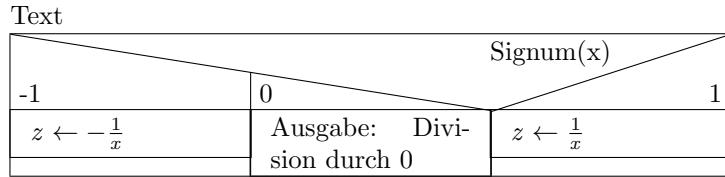

In many cases structured box charts are recorded in particular files such, that they can be tested separately, if they are correct, or that they can be used in other connections. If they should be included centeredly, then one can not use the following construction:

```
\begin{center}
    \input{...}
\end{center}
```

since this way the whole text in structured box chart would be centered. To deal with this case in a simple and correct way the macro `\CenterNssFile` can be used. It is also defined in the style `centernssfile`. This requires, that the file containing the instructions for the structured box chart has the file name extension `.nss`. That is why the name of the file, that has to be tied in, *must* be stated without extension. If the file `struktex-test-0.nss` has the shape shown in paragraph 5, line 2–10 the instruction

```
\centernssfile{struktex-test-0}
```

leads to the following shape of the formatted text:

`\openstrukt`
`\closestrukt`

These two macros are only preserved because of compatibility reasons with previous versions of `StyukTeX`. Their meaning is the same as `\struktogramm` and `\endstruktogramm`. The syntax is

```
\openstrukt{\langle width \rangle}{\langle height \rangle}
```

and

```
\closestrukt.
```

`\assert`

The macro `\assert` was introduced to support the verification of algorithms. It is active only if the option `verification` is set. It serves the purpose to assert the value of a variable at one point of the algorithm. The syntax corresponds to the syntax of `\assign`:

```
\assert[\langle height \rangle]{\langle assertion \rangle},
```

Its usage can be seen from the following:

```
\begin{struktogramm}(70,20)[Assertions in structured box charts]
    \assign{\(a\gets a^2\)}
    \assert{\(a\geq 0\)}
\end{struktogramm}
\sProofOff
```

The resulting structured box chart looks like

Assertions in structured box charts

$a \leftarrow a^2$
$a \geq 0$

5 Example file for including into the documentation

The following lines build up an example file, which is needed for the preparation of this documentation; there is only an german version.

```

60 <*example1>
61 \begin{struktogramm}(95,40)[Text]
62   \case[10]{3}{3}{\operatorname{Signum}(x)}{-1}
63     \assign{\(z \gets -\frac{1}{x})}
64   \switch{0}
65     \assign{Ausgabe: Division durch 0}
66   \switch[r]{1}
67     \assign{\(z \gets \frac{1}{x})} \caseend
68 \end{struktogramm}
69 </example1>
```

6 Some example files

6.1 Example file for testing purposes of the macros of **struktex.sty** without any optional packages

The following lines build up a model file, that can be used for testing the macros.

```

70 <*example2>
71 \documentclass[draft]{article}
72 \usepackage{struktex}
73
74 \begin{document}
75
76 \begin{struktogramm}(90,137)
77   \assign%
78   {
79     \begin{declaration}[]
80       \description{(a, b, c)}{three variables which are to be sorted}
81       \description{(\tmp)}{temporary variable for the circular swap}
82     \end{declaration}
83   }
84   \ifthenelse{1}{2}{\((a \leq c)\)}{j}{n}
85   \change
86   \assign{(\tmp \gets a)}
87   \assign{(a \gets c)}
88   \assign{(c \gets \tmp)}
89   \ifend
90   \ifthenelse{2}{1}{\((a \leq b)\)}{j}{n}
91   \ifthenelse{1}{1}{\((b \leq c)\)}{j}{n}
```

```

92   \change
93   \assign{\tmp\gets c\}
94   \assign{(c\gets b\)}
95   \assign{(b\gets tmp\)}
96   \ifend
97   \change
98   \assign{\tmp\gets a\}
99   \assign{(a\gets b\)}
100  \assign{(b\gets tmp\)}
101  \ifend
102 \end{struktogramm}
103
104 \end{document}
105 </example2>

```

6.2 Example file for testing purposes of the macros of **struktex.sty** with the package **pict2e.sty**

The following lines build up a template file, that can be used for testing the macros.

```

106 <*example3>
107 \documentclass{article}
108 \usepackage[pict2e, verification]{struktex}
109
110 \begin{document}
111 \def\StruktBoxHeight{7}
112 %\$ProofOn{}
113 \begin{struktogramm}(90,137)
114   \assign%
115   {
116     \begin{declaration}[]
117       \description{(a, b, c)}{three variables which are to be sorted}
118       \description{(\tmp{})}{temporary variable for the circular swap}
119     \end{declaration}
120   }
121   \assert[\StruktBoxHeight]{\$True}
122   \ifthenelse[\StruktBoxHeight]{1}{2}{(a\leq c)\{j\}\{n}}
123     \assert[\StruktBoxHeight]{(a\leq c\)}
124   \change
125     \assert[\StruktBoxHeight]{(a>c\)}
126     \assign[\StruktBoxHeight]{(\tmp\gets a\)}
127     \assign[\StruktBoxHeight]{(a\gets c\)}
128     \assign[\StruktBoxHeight]{(c\gets tmp\)}
129     \assert[\StruktBoxHeight]{(a<c\)}
130   \ifend
131   \assert[\StruktBoxHeight]{(a\leq c\)}
132   \ifthenelse[\StruktBoxHeight]{2}{1}{(a\leq b)\{j\}\{n}}
133     \assert[\StruktBoxHeight]{(a\leq b \wedge a\leq c\)}
134     \ifthenelse[\StruktBoxHeight]{1}{1}{(b\leq c)\{j\}\{n}}
135       \assert[\StruktBoxHeight]{(a\leq b \leq c\)}
136     \change
137       \assert[\StruktBoxHeight]{(a \leq c < b\)}
138       \assign[\StruktBoxHeight]{(\tmp\gets c\)}
139       \assign[\StruktBoxHeight]{(c\gets b\)}

```

```

140      \assign[\StruktBoxHeight]{\b\gets tmp}
141      \assert[\StruktBoxHeight]{\a\le b<c}
142      \ifend
143      \change
144          \assert[\StruktBoxHeight]{\b < a\le c}
145          \assign[\StruktBoxHeight]{\tmp\gets a}
146          \assign[\StruktBoxHeight]{\a\gets b}
147          \assign[\StruktBoxHeight]{\b\gets tmp}
148          \assert[\StruktBoxHeight]{\a<b\le c}
149      \ifend
150      \assert[\StruktBoxHeight]{\a\le b \le c}
151 \end{struktogramm}
152
153 \end{document}
154 
```

6.3 Example file for testing the macros of **struktxp.sty**

The following lines build a sample file, which can be used for testing the macros of **struktxp.sty**. For testing one should delete the comment characters before the line `\usepackage[T1]{fontenc}`.

```

7 Macros for generating the documentation of the **struktex.sty**

To simplify the formatting of the documentation some macros are used, which are collected in a particular .sty file. An essential part is based on a modification of the `newtheorem` environment out of `latex.sty` for distinguishing examples. The implementation of abbreviations has been proposed in [Neu96].

Therefore some instructions of `verbatim.sty` have been adopted and modified, so that writing and reading by the `docstrip` package works. Finally an idea of Tobias Oetiker out of `layout.sty` also has been used, which has been developed in connection with "lshort2e.tex – The not so short introduction to LaTeX2e".

734 #-----
735
736 # The texmf-directory, where to install new stuff (see texmf.cnf)
737 # If you don't know what to do, search for directory texmf at /usr.
738 # With teTeX and linux often one of following is used:
739 #INSTALLTEXMF=/usr/TeX/texmf
740 #INSTALLTEXMF=/usr/local/TeX/texmf
741 #INSTALLTEXMF=/usr/share/texmf
742 #INSTALLTEXMF=/usr/local/share/texmf
743 # user tree:
744 #INSTALLTEXMF=$(HOME)/texmf
745 # Try to use user's tree known by kpsewhich:
746 INSTALLTEXMF='kpsewhich --expand-var '$$TEXMFHOME'
747 # Try to use the local tree known by kpsewhich:
748 #INSTALLTEXMF='kpsewhich --expand-var '$$TEXMFLOCAL'
749 # But you may set INSTALLTEXMF to every directory you want.
750 # Use following, if you only want to test the installation:
751 #INSTALLTEXMF=/tmp/texmf
752
753 # If texhash must run after installation, you can invoke this:
754 TEXHASH=texhash
755
756 ##### Edit following only, if you want to change defaults!
757
758 # The directory, where to install *.cls and *.sty
```

```

759 CLSDIR=$(INSTALLTEXMF)/tex/latex/${PACKAGE}
760
761 # The directory, where to install documentation
762 DOCDIR=$(INSTALLTEXMF)/doc/latex/${PACKAGE}
763
764 # The directory, where to install the sources
765 SRCDIR=$(INSTALLTEXMF)/source/latex/${PACKAGE}
766
767 # The directory, where to install demo-files
768 # If we have some, we have to add following 2 lines to install rule:
769 #     $(MKDIR) $(DEMODIR); \
770 #     $(INSTALL) $(DEMO_FILES) $(DEMODIR); \
771 DEMODIR=$(DOCDIR)/demo
772
773 # We need this, because the documentation needs the classes and packages
774 # It's not really a good solution, but it's a working solution.
775 TEXINPUTS := $(PWD):$(TEXINPUTS)

```

The following line – stripped off as `struktex.makemake` – can be used with the command
`sh struktex.makemake`

to generate the file `Makefile`, which can be further used to generate the documentation with a common `make` like the GNU `make`.

```

994 (*setup)
995 sed -e "echo \"s/^ @/g\" | tr '@' '\011'" struktex.mk > Makefile
996 </setup>

```

9 Style File for easier input while working with (X)emacs and AUCTEX

The (X)emacs and the package AUCTEX (<http://www.gnu.org/software/auctex/>) form a powerful tool for creating and editing of T_EX/L^AT_EX files. If there is a suitable AUCTEX style file for a L^AT_EX package like the hereby provided St^RukturT_EX package, then there is support for many common operations like creating environments and so on. The following part provides such a style file; it must be copied to a place, where (X)emacs can find it after its creation.

This file is still in a development phase, i. e. one can work with it, but there is a couple of missing things as for example font locking or the automatic insertion of `\switch` commands according to the user's input.

```

997 (*auctex)
